Data Warehouse API Overview

The Kaseya Data Warehouse API comprises a set of client-initiated HTTP URI requests that return corresponding responses from a specified Kaseya Server.

The Kaseya REST API enables 3rd party applications like a Business Intelligence (BI) platforms (Microsoft PowerBI, Tableau) to integrate with the Kaseya Server and get data from Info Center's datasets in a structured JSON-format based on OData standard.

The OData Protocol is an application-level protocol for interacting with data via RESTful interfaces. The protocol supports the description of data models and the editing and querying of data according to those models.

Resource URIs

Supported URIs are used to access resources. The basic format shown in documentation is:

GET /AgentProcedureStatuses

GET is the HTTP method.

AgentProcedureStatuses is the resource URI.:

When you enter the complete format in your browser, the URI looks like this:

<https://<yourVSA server domain>/api/odata/v1.0/AgentProcedureStatuses>

Schema

A schema describes the fields and data types returned by a single record in a response. Each resource URI has corresponding schema description. Swagger interface available at the /api/odata/swagger endpoint.

Authentication

HTTP Basic Authentication

The HTTP Authorization request header can be used to provide credentials that authenticate a user agent with a server, allowing access to a protected resource.

Authorization: Basic <credentials>

Credentials – base64 encoded username:userToken

Where the userToken can be obtained on the VSA portal. It must have Data Warehouse API scope.

Example:

user2:\$apr1\$O04r.y2H\$/vEkesPhVInBByJUkXitA/

Rest API Tools

There are many free REST API tools you can use to experiment with creating Kaseya Data Warehouse API requests and seeing the corresponding responses. Recommended tools include Postman, Fiddler and Swagger.io.

OData feed support

Business Intelligence (BI) platforms Microsoft PowerBI and Tableau have native OData support.

Request Guidelines

HTTP Methods

Kaseya Data Warehouse API requests use the following HTTP methods:

GET - returns data

Sample Request and Response

It is best to look at the "shape" of a sample request and response before discussing its structure in detail.

```
GET /api/odata/1.0/AgentProcedureStatuses HTTP/1.1
Host: 10.10.32.110
Authorization: Basic QWxhZGRpbjpvcGVuIHNlc2FtZQ==
```

The JSON response from the Kaseya VSA Data Warehouse API looks like this:

```
{
  "@odata.context": "https://reporting-develop-vsa.dev.kaseya.net/api/odata/1.0/$metadata#AgentProcedureStatuses",
  "value": [
    {
      "AgentId": "118551706373495",
      "PartitionId": "1",
      "ProcedureName": "Baseline Application Audit",
      "ProcedureId": 2007,
      "LastExecutionDateTime": "2021-11-08T00:30:53.087-08:00",
      "LastExecutionStatus": "Script Summary: Success THEN",
      "ActionUser": ""
    }
  ]
}
```

The `Result` field in the response contains one or more records of business data.

Security

Each API call returns only data for a single tenant/partition. Partition id is derived from user's token partition. Records are returned by a request is limited by the scope and role of the VSA user, which was used to generate the API access token.

Filter, Sort and Paging Expressions

When multiple records are returned by a GET request, OData expressions can be applied according to the standard specification. The three types of expressions determine whether the multiple records are

Data Warehouse API Overview

filtered, sorted, or paged. Documentation identifies whether a field is filterable or sortable. Paging expressions are always available for any GET method that returns multiple records.

Multiple OData expressions can be combined in the same URI. In the following example, the first OData expression is delimited by a question (?) character. Subsequent OData expressions are delimited with an ampersand (&) character.

For example:

```
GET /api/odata/1.0/AgentProcedureStatuses?$skip=30&$top=10&$orderby=ActionUser
```

More information about querying data you may find in the OData documentation -

<https://www.odata.org/getting-started/basic-tutorial/#queryData>

Authentication

Secured by design: Basic authentication protocols.
